

A world map illustrating the global distribution of COVID-19 cases by country. The map uses a color scale to represent the number of cases, with a logarithmic scale indicated on the right side, ranging from 10^3 (light yellow) to 10^9 (dark red). The United States and the United Kingdom are shown in the darkest red, indicating the highest number of cases. Other countries in red include Canada, Australia, and several in South America and Europe. Orange and yellow colors represent countries with fewer cases, while white areas represent regions with no reported cases or data not available. The map shows a high concentration of cases in North America, Europe, and Australia, with lower concentrations in Africa, South America, and parts of Asia and the Pacific.
